```
import math
#This makes it so that we will be able to use commands like math.sqrt and more.

print("Hi User! Welcome to Your Personal Distance Calculator!")

x1  = float(input("Enter x1: "))
y1 = float(input("Enter y1: "))
x2 = float(input("Enter x2: "))
y2 = float(input("Enter y2: "))
#These ask the user for the necessary values to be used in calculating for the distance between two points.

x = pow(x2 - x1, 2)
y = pow(y2 - y1, 2)
distance = math.sqrt(x + y)
#This is where the distance between two points is truly calculated using the values given.

print ("The distance between the two points is: ", distance)
#This displays the result/distance between two points after calculation.
```
